

Webflow CRM Lead Integration — User Guide

This guide walks you through connecting a **Webflow form** to **Odoo CRM** so that every submission automatically becomes a CRM lead. It is written for the Odoo administrator who sets the integration up and for the sales users who work the leads afterwards.

Compatible with **Odoo 18 and 19**. Module: `webflow_crm_integration`.

1. What it does

```
Webflow form (submit) --> POST /webflow/webhook (secret / HMAC) --> Odoo lead service (field mapping, duplicate check) --> CRM Lead
```

- A visitor submits a form on your published Webflow site.
- Webflow sends the submission to Odoo's secure webhook endpoint.
- Odoo validates the request, maps the fields, and **creates or updates** a CRM lead — applying your default sales team, salesperson, stage, source and tags.
- Every request is logged, and failures are retried automatically.

2. Where everything lives

Everything is under **CRM -> Configuration -> Webflow Integration**:

Menu	Purpose
Configuration	The main settings page (enable, defaults, credentials, webhook, notifications).
Connection Wizard	A guided, step-by-step way to connect Webflow.
Dashboard	Health metrics: volume, success rate, today's leads, last sync.
Field Mappings	Define how Webflow fields map to CRM lead fields.
Integration Logs	Every webhook request, with payload, status and one-click retry.

Who can access it

Group	Can do
Webflow: User	View the Dashboard and Integration Logs.
Webflow: Administrator	Everything, including settings, credentials and mappings.

System administrators are Webflow Administrators automatically. Assign the groups under **Settings -> Users & Companies -> Users**.

3. Quick start (about 5 minutes)

1. **CRM -> Configuration -> Webflow Integration -> Configuration.**
2. Turn on **Enable Webflow Integration**.
3. Under **Webflow Credentials**, paste your **API Token** and **Site ID**, then click **Test Webflow API** — you should see a green [OK] confirmation.
4. Under **Webhook Endpoint**, click **Register Webhook in Webflow** (Automatic setup). This creates the Form Submission webhook in Webflow for you, URL and secret included.
5. Click **Send Test Webhook** — a test lead should appear, and a **Success** row should show in **Integration Logs**.
6. Publish your Webflow site and submit the real form to confirm.

That's it. The sections below explain each option in detail and cover the manual setup path if you prefer not to share an API token.

4. Configuration in detail

Open **CRM -> Configuration -> Webflow Integration -> Configuration**.

4.1 General

Enable Webflow Integration — the master switch. While this is **off**, the webhook endpoint rejects all requests (**HTTP 403**), so nothing is created.

4.2 Defaults (applied to every imported lead)

Setting	Meaning
Companies	The companies this integration serves. New leads are created in the first selected company; the rest define scope. (Shown only in multi-company databases.)
Default Sales Team	Sales team assigned to new leads.
Default Salesperson	Owner assigned to new leads.
Default Lead Stage	Starting CRM stage.
Default Lead Source	UTM source stamped on the lead (unless the form sends its own).
Default Tags	Tags added to every imported lead.

Auto-fill. The first time you open the settings, a couple of fields are pre-populated to save you a step:

- **Companies** -> every company you have access to (or your previous single-company setting if upgrading).
- **Default Tags** -> a tag named "Webflow" if one already exists, otherwise left as-is.

Default Sales Team, Default Salesperson, Default Lead Stage and Default Lead Source are left blank on purpose — choose them explicitly for your setup.

Auto-filled values are only suggestions until you click **Save**, and any value you have already saved is never overwritten. Change any of them freely.

4.3 Duplicate detection

Matches are found by **email** or **phone** within the target company. *Update* refreshes the existing lead's fields; *Skip* ignores the submission (and logs it as *Skipped*).

4.4 Webflow credentials

Field	Notes
Webflow API Token	A token from your Webflow workspace with webhook scope . Stored securely, shown masked.
Site ID	Your Webflow Site ID.
Workspace ID / Collection ID / Form ID	Optional; for reference and future features.
API Version	Defaults to 2.0.0 (Webflow Data API v2). Leave as-is unless told otherwise.

Buttons:

- **Test Webflow API** — validates the token + Site ID against Webflow.
- **Open Documentation** — opens Webflow's webhook docs.

4.5 Webhook endpoint

Field	Notes
Webhook URL	The public endpoint, e.g. https://your-odoo.com/webflow/webhook . Copy it into Webflow.
Webhook Secret	Shared secret used to authenticate requests. Copy / regenerate as needed.
Require HMAC Signature	Stricter validation using Webflow's signed webhooks — see Security .

Actions are grouped:

- **Automatic setup** (in the recommended order)
- **Open Setup Wizard** — the guided connection flow; a good first stop.
- **Register Webhook in Webflow** — uses your API token to create the Form Submission webhook automatically (URL + secret included). Requires a token with webhook scope. *Turn off "Require HMAC Signature" for this query-string secret method.*
- **Verify / List Webhooks** — lists the webhooks currently registered on the site so you can confirm.
- **Manual setup & utilities**
- **Regenerate Secret** — issues a fresh secret (remember to update Webflow).
- **Send Test Webhook** — simulates a submission to confirm lead creation.

4.6 Notifications

Setting	Meaning
Notify Salesperson	Subscribes and notifies the assigned salesperson on each new lead.
Create Activity	Schedules a "Follow up on Webflow lead" to-do activity for the salesperson.

5. Connecting a Webflow form

You have two paths. **Automatic** is fastest; **Manual** avoids sharing an API token.

Option A — Automatic (recommended)

1. (Optional) Click **Open Setup Wizard** for a guided walkthrough — it's the first button in the *Automatic setup* group.
2. Enter your **API Token** and **Site ID**, then **Test Webflow API**.
3. Click **Register Webhook in Webflow**. Existing Form Submission webhooks that point at this Odoo endpoint are replaced, so the secret stays in sync.
4. Click **Verify / List Webhooks** to confirm it is registered.
5. **Publish** your Webflow site.

Option B — Manual

1. Copy the **Webhook URL** and **Webhook Secret** from Odoo (or run the **Connection Wizard**).
2. In Webflow, open **Project Settings -> Integrations / Webhooks** (or use Webflow Logic / form automation on plans that support it).
3. Add a webhook with:
 - **Trigger = Form Submission**
 - **URL** = the Odoo webhook URL. To pass the secret in the URL, append it as a query string: `.../webflow/webhook?secret=YOUR_SECRET`.
 - Or send the secret as the HTTP header `X-Webhook-Secret: YOUR_SECRET`.
4. **Publish** your Webflow site.
5. Submit the form (or use **Send Test Webhook**) and check **Integration Logs**.

6. Field mapping

Go to **CRM -> Configuration -> Webflow Integration -> Field Mappings**.

Each row maps one **Webflow field name** to a **CRM lead field**. Matching is **case-insensitive**, so `Contact Email`, `contact email`, and `CONTACT EMAIL` all work.

Default mappings shipped with the module

Webflow field	CRM lead field	Type
Contact Name	Contact Name	Text
Contact Email	Email	Email
Contact Number	Phone	Phone
Company Name	Company Name	Text
Subject	Opportunity / Lead name	Text
Contact Message	Description	Text
service type	Tags	CRM Tag
Budget	Expected Revenue	Number
Country	Country	Country
Page URL	Source Page URL	Text
UTM Source	Source	UTM Source
UTM Medium	Medium	UTM Medium
UTM Campaign	Campaign	UTM Campaign

These names match a specific Webflow form. **Rename the "Webflow field" values to match your own form's field labels** — that is the single most common setup step. Reorder with the drag handle; deactivate a row with its toggle.

Mapping types

Type	Behaviour
Text / Email / Phone	Written as-is to the target field.
Number	Cleaned (\$12,500 -> 12500) and written to a numeric field.
CRM Tag	Finds or creates a crm.tag and adds it to the lead.
Country	Matches a country by name or ISO code.
UTM Source / Medium / Campaign	Finds or creates the matching UTM record.

Every write is validated against the real CRM field type. A misconfigured mapping (e.g. text into a number field) is **skipped with a warning** rather than crashing the whole submission.

Capturing the submission page

Webflow sends the page URL outside the form data. The module exposes it as a field named **Page URL**, mapped by default to **Source Page URL** on the lead.

7. Testing your setup

- **Send Test Webhook** (settings) — creates a sample lead end-to-end.
- **Integration Logs** — every request appears here. A green **Success** row with a linked lead means it worked.
- Submit the **real form** on the published site and confirm the lead appears in **CRM -> Leads** (use the **From Webflow** filter).

8. Dashboard

CRM -> Configuration -> Webflow Integration -> Dashboard shows:

- **Total / Successful / Failed / Skipped** webhook counts.
- **Success Rate (%)** and a **Health** badge:
- **Healthy** >= 90% success
- **Degraded** >= 60%
- **Unhealthy** < 60%
- **No Activity** when nothing has been received yet
- **Today's Leads** and **Last Sync**.
- Buttons to jump to **All Logs** or **Failed Only**.

Click **Refresh** to recompute.

9. Integration logs & retries

Each log row records the event, form name, status, HTTP code, linked lead, processing time, retry count, source IP, the raw payload, and any error message.

- **Retry** (button on failed/skipped rows) re-processes the stored payload.
- A **scheduled action** automatically retries failed imports **every 10 minutes**, up to **5 attempts** per record. So a transient error usually recovers on its own.

10. Troubleshooting

Symptom	Likely cause & fix
Webhook returns 403 Integration disabled	Turn on Enable Webflow Integration .
401 Invalid webhook secret	The secret in Webflow doesn't match Odoo. Copy it again, or Regenerate Secret and update Webflow.
401 Missing HMAC signature	Require HMAC Signature is on but Webflow isn't sending a signed webhook. Either use Webflow's signed webhooks, or turn HMAC off and use the shared-secret method.
429 Too many requests	Rate limit hit (60 requests/minute per IP). Normal traffic won't trigger this.
Lead created but fields empty	Your Webflow field names don't match the Field Mappings . Rename the mappings to match your form. Check the log payload to see the exact keys Webflow sent.
Test Webflow API fails with 401/403	Invalid API token or missing webhook scope.
Test Webflow API fails with 404	Wrong Site ID.
"requests" library not available	The Python requests package is missing from the Odoo runtime (only affects the API/registration buttons, not inbound webhooks).
Duplicates piling up	Turn on Duplicate Detection and pick Update or Skip .

To see exactly what Webflow sent, open the failing row in **Integration Logs** and read the **Payload** tab.

11. Security

- Every inbound request must carry the correct **secret** (header or query string), or a valid **HMAC-SHA256** signature when HMAC mode is enabled.
- **HMAC mode** verifies the **x-webflow-signature** / **x-webflow-timestamp** headers. It only works if your Webflow signing key equals the configured secret — for the simple query-string method, leave HMAC **off**.
- Requests are **rate-limited** per source IP (best effort, per worker).
- Credentials are stored via **ir.config_parameter**, shown masked, and never printed in list views.
- Configuration is limited to the **Webflow: Administrator** group.

12. FAQ

Does this send data back to Webflow?

No. Odoo only receives submissions. The API token is used only to test the connection and to register/list webhooks.

Can I use more than one form or site?

Yes. Point multiple Webflow forms at the same webhook URL. Use **Field Mappings** that cover all the field names your forms use.

Which company gets the lead in a multi-company setup?

The **first** company in the **Companies** list. The others define the scope of the setup.

Will re-installing/upgrading lose my mappings?

No. Default mappings are marked **noupdate**, so your edits are preserved across upgrades.
